

Independent Verification and Validation

Proprietary Methodology and tool set that provides a detailed view into a system's internal workings and behavior

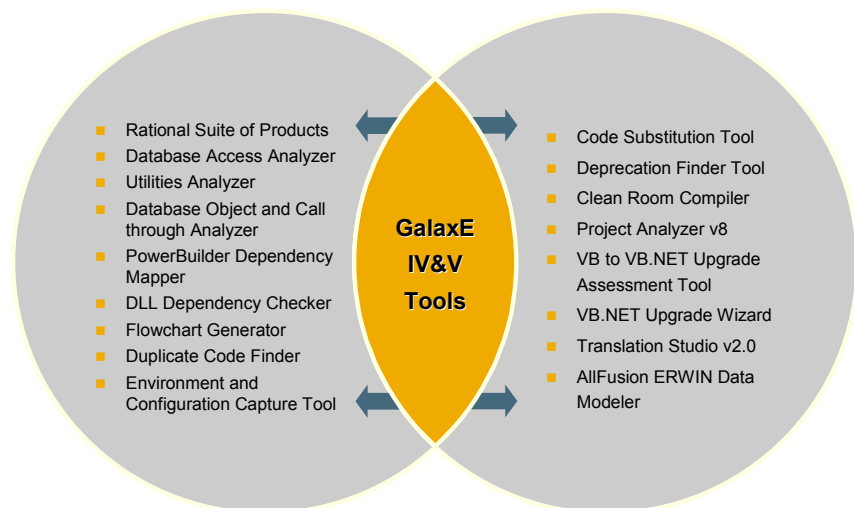

Founded in 1990, GalaxE.Solutions®, Inc. (GalaxE), is an industry leader in designing and deploying business processes and supporting systems that enable clients to transact and share information across internal networks and the Internet, targeting business results, competitiveness and efficiency.

GalaxE's proprietary ISO-12207-based Independent Verification and Validation (IV&V) methodology and tool set provides a profound view into a system's internal workings and behavior, and is used to define technology roadmaps. These technology roadmaps provide clear direction that ensures viability, organizational readiness, capacity planning, vendor management, data worthiness and a complete project plan, along with the appropriate accompanying support and management processes.

GalaxE's IV&V:

- Reviews usage of data for simulation of historical and daily scenarios
- Analyzes management of data and correctness, as well as various queries and reports for response times
- Performs due diligence for regulated applications
- Exposes scalability/validation issues early in development cycle
- Renders system performance profiles along with what-if scenarios
- Enables development of test management solutions and validation of results through stress tests
- Documents existing systems/applications
- Identifies performance-critical components and relationships, as well as key technologies that contribute to competitive advantage
- Counsels client resources on use of new technologies described/introduced
- Defines requirements, functional specifications and design for enhancements

For more information about GalaxE's IV&V and professional services expertise and how they can help your business today, please contact Tore Carlson at 732-868-0400 x221, or e-mail, tcarlson@galaxesolutions.com.
